Email: sequence fâgenoscope.cns.fr. Web : www.genoscope.cns.fr. Web : www.genoscope.cns.fr. Web is trand cDNA was primed with a Not1-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library was not normalized. Library was constructed by Life Technologies, a division of Invitrogen.

This sequence belongs to sequence cluster 4537.r.

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCWVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
division of Invitrogen.

// site 2: Not I: NOI CGAP_EDI is a normalized—CDNR library
// containing the following tissue(s): Chondrosarcoma cell
line CSs. The library was constructed according to
Bonaldo, Lemnon and Soares, Genome Research, 6:791-806,
oligo-dT primer containing a Not I site. Double stranded
cDNR was ligated to an EcoR I site. Double stranded
oligomucleoride used to prime the synthesis of conted between the Not I site and the (dT)18 rail. The
sequence tag for this library is GCTCAAGGCT.

// Site 2: NOT1; The poly (A) + RNA was dephosphorylated with bacterial alkaline phosphatase (BAP) and then decapped with tabacco acid pyrophosphatase (TAP). The decapped intext mRNA was ligated with DNA-RNA linker including ECOR is site by treatment of T4 RNA ligase and the first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The cDNA vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coll DNA ligase after digestion of ECORI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coll TOplOF' by electroporation method. The CDNA libraries constructed by this method are full-length enriched CDNA library."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1818

/uncte="Vector: pCMV-Sport6; Site 1: Not1; Site 2: Sal1; /note="Vector: pCMV-Sport6; Site 1: Not1; Site 2: Sal1; This is a long-transcript enriched CDNA library (Genome Res. 11: 1553-1558 (2001). [PMID: 11544199] From WA01 cell line . Undifferentiated human ES cell line WA01 was obtained from Wiccall Research Institute. Inc., Madison, Wi, cultured according to their instructions on MEF feeders. They formed round colonies with defined edges and were positive for alkaline phosphatase, SERA-4, OCT3, OCT4, REX1, OTF, TERT, SOX2, CX43 and CX45. They are negative for GATA2, GATA4, PDX1, NCAM, MSX1, FLT3, SERA-1, TUBB3, NES, GFAP, and EOMES. When confluent (18-10 days after plating), the ES cells from 4 X cm dishes were treated with 1 mg/ml collegenase, type IV (Invitrogen/GIECO) for 5-10 min and gently scraped off with 5 ml pipette. RNA was purified with TRIZOl Reagent from Invitrogen. Protocol ref Genome Res. 11: 1553-1558 (2001). [PMID:1154199]) Double-stranded cDNAs were synthesized with an oligo(dT) primer [Invitrogen: STAA4199]) Double-stranded cDNAs were applied by ethanol-precipitation. The CDNAs were amplified by long-range high fidelity PCR using Ex Taq polymerase (Takara) with a primer Sal-4. For 25 cycles. The products (Texara) with a primer Sal-4. For 25 cycles. The products were purified by phenol/chloroform extraction and separated from kree linkers by Centricon-100 column. The cDNAs were adgested with Sal and Not! enzymes and cloned into Sal1/Not! site of about 3.6kb."

Diagnosing malignant neoplasm in a mammal, involves contacting mammalian sample with antibody that binds to human aspartyl beta-hydroxylase polypeptide to form antigen-antibody complex and detecting the complex.

The present sequence encodes a human aspartyl (asparaginyl) beta-hydroxylase (HAAH) enzyme. Epidermal growth factor (EGF)-like domains of

```
polypeptides are hydroxylated by HAAH enzymes. HAAH is used in the method of the invention. The specification describes a method for diagnosing a malignant neoplasm in a mammal. The method comprises contacting a body fluid with an antibody which binds to HAAH polypeptide under complex forming conditions, and detecting the antigen-antibody complex. The method is useful for diagnosing and prognosing a malignant neoplasm in a bodily fluid e.g. central nervous system (CNS) derived body fluid, blood, where the neoplasm is derived from endodermal tissue and is selected from concer, breast cancer, practice cancer, liver cancer, cancer of bile ducts, and cancer of the CNS. HAAH antibodies, linked to a cytotoxic agent, are useful for killing tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  840

The invention relates to diagnosing a neoplasm and inhibiting tumour of growth in a mammal. Using an antibody that binds to human aspartyl (asparaginyl) beta-hydroxylase (HAAH). Diagnosing a neoplasm comprises of in level of antibody binding at tissue site compared to the level of intibody binding at tissue site compared to the level of intibody binding at tissue indicates the presence of a indicate antibody conjugated to a cyclotoxic agent to a mammal. Conspaints terring the antibody conjugated to a cyclotoxic agent to a mammal. Involves administering the antibody conjugated to a cyclotoxic agent to a mammal. Dry administering to the mammal and included are a method of conferring an immune response to a tumour cell in a mammal, by administering to the mammal and HAAH-specific immune response in a mammal, by administering to the mammal polypeptide, or its degenerate variant), a fragment of HAAH-comprising an extracellular domain and lacking a cytoplasmic domain of HAAH, and the polypeptide, or its degenerate variant), a fragment of HAAH, and the strangent which binds to HAAH (where the antibody is FBSO, 685, 5C7 or its) a mybridoma cell line chosen from Mybridoma FBSO, 4386A, HAISCA and HAA19B, and a fragment of HAAH which lacks enzymatic activity or alpha-ketogluterate binding domain and epidermal growth factor (EGF)-like domain. The methods are useful for diagnosing malignant cor haemangloma) in a mammal, for conferring immune response to a pararreatic carcinoma cell and for inducing a HAAH-specific immune response in a mammal, for conferring immune response to a parain tumour call (e.g. glioma, glioblastoma, astrocytoma cell original manger conferring immune response in a mammal. For cancer and cancer, phorestelic carcinoma cell and for inducing a HAAH-specific immune ceponse in a mammal for diagnosing neplasms derived from endodermal tissue, e.g. colon cancer, phorestelic carcinoma cell conferring cancer of the bile duces of cancer. Indivarse and cancer of the bile duces of cancer indiagnosing neglement seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dp
                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method for inhibiting tumour growth in a mammal. The method comprises administering to the mammal a compound, which inhibits the expression or enzymatic activity of a human aspartyl (asparaginyl) beta-hydroxylase (HAAH) The compound may inhibit HAAH hydroxylation of a NOTCH POlypeptide. In particular, the compound may inhibit hydroxylation of an epidermal growth factor (EGF)-like repeat sequence in a NOTCH polypeptide. The methods are useful for inhibiting tumour growth or killing tumour cells, or for diagnosing or prognosticating a malignant neoplasm. In particular, the tumour or neoplasm is colon cancer, breast cancer, pancreatic cancer, liver cancer, system (CNS). The present sequence encodes HAAH.
                                                                                                                                                                                                                                                                            Inhibiting tumor growth or killing tumor cells (e.g. cancer of the colon, breast, pancreatic, liver or the central nervous system), by administering an inhibitor of the human aspartyl (asparaginyl) betahybdroxylase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180

The invention relates to a novel isolated nucleic acid and the PRO polyapetide encoded by it. A protein of the invention has polyapetide encoded by it. A protein of the invention has antinilammatory, antiathetic, antiahematic; immunosuppressive, careopathic, antidiabetic, dermatological, antiabsouppressive, antiathetic, hepatotropic, and respiratory activity. A polyanclectide attiasthmatic, hepatotropic, and respiratory activity. A polyanclectide of the invention may have a use in gene therapy. The PRO polypeptide, its ogonist, antagonist, or antibody that specifically binds to the construction may have a use in gene therapy. The PRO polypeptide, its polyapetide is useful for treating an immune related disorder such as systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, civenila chronic arthritis, a spondyloarthropathy, systemic solerosis, andiamatory myopathy, Sjogren's syndrome, systemic arcidosis, autoimmune haemolytic anaemia, autoimmune chronic arthritis, partnessing disease of the central or peripheral nervous disease, a demyelinating disease of the central or peripheral nervous constemn, idiopathic demyelinating polyneuropathy, a hepatobiliary disease, inflammatory demyelinating polyneuropathy, a hepatobiliary cirhosis, granulomatous hepatitis, sclerosing cholaniary cirhosis, granulomator hepatitis, sclerosing cholaniary cirhosis, granulomane or immune mediated skin disease, a bullous skin disease, asthma, allergic rhintis, atopic dermatitis, poor disease, asthma, allergic rhintis, atopic dermatitis, poor disease, asthma, allergic rhintis, atopic dermatitis, code to hypersensitivity, urricaria, an immunologic disease of the lung, conscined disease, graft rejection or preumonitis, a transplantation associated disease, graft rejection or preumonitis, are present sequence encodes a PRO protein of graft-versus. graft-versus-host disease. The present sequence encodes a

Specifically, it refers to a method for the identification of target genes whose expression is correlated with an early stage in the capulation of apoptosis. The present invention describes a method of contacting either candidate agents or control agents to the target genes contacting either candidate agents or control agents to the target genes and assessing the difference of binding and inhibitory activity, where the candidate agent is selected from a low molecular weight organic molecule, an antibody or fragment thereof, an antisense oligonucleotide, a small inhibitory dsRNA, or a ribozyme. As such, the compositions and associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodepencrative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and neuroprotective activities. These may also be used for drug screening courses and in gene therapy. This polynucleotide sequence is a human the regulation of apoptosis that can be applied the activities of the regulation of apoptosis that can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                 Identifying an agent that modulates the function of an apoptosis-
associated polypeptide, useful for diagnosing or treating e.g. cancer,
comprises comparing the binding of the polypeptide to the candidate agent
and to a control agent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09

The invention relates to new isolated nucleic acid molecule comprising a cell not acid molecule consisting of a gene differentially expressed in cells undergoing differentiation from mesenchymal cell to a cells undergoing differentiation from mesenchymal cell to a chondroblastic phenotype, or hybridising under stringent conditions to transformed host cells, expressed polypeptides or poptide fragments of the molecule or their fragments. Also included are expression vectors, which induce differentiation of a mesenchymal cell and may be used as an identifying an agent useful in modulating mesenchymal cell and may be used as an identifying an agent useful in modulating mesenchymal cell and condition characterized by aberrant expression of a nucleic acid molecule or its expression product, a method for determining regression, progression or onset of cartilaginous tissue degeneration condition in a condition characterised by aberrant expression of a nucleic acid molecule or its expression product, a method for treating a cartilaginous tissue degeneration condition, a method for identifying a candidate agent for treating a cartilaginous tissue cartilaginous tissue degeneration condition, and a solid-phase nucleic cartilaginous tissue degeneration condition, and a solid-phase nucleic cartilaginous tissue degeneration condition, and a solid-phase nucleic card molecule array consisting essentially of a set of nucleic acid differentially expressed in developing mesenchymal cells using the cechnique of representational difference analysis, RDA), its expression conditions and agentes are useful for treating cartilaginous tissue degeneration conditions are useful for treating detrimined cardidated degeneration conditions are useful for treating deformance of regeneration or and account of a solid-phase and agentes are useful for treating derivations degeneration conditions are useful for treating deformation conditions are useful for treating deformation conditions are useful for treating deformations of archivet or fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New nucleic acid molecules capable of promoting chondrogenesis, useful for diagnosing and treating cartilaginous tissue degeneration conditions, e.g. osteoarthritis, rheumatoid arthritis, gout arthritis, or
